00 / PORTFOLIO

STEFANOS PAPADOPOULOS

CONSTRUCTION MANAGER / FTTH INFRASTRUCTURE

SURVEYING ENGINEER

From coordinating construction crews to as-built surveying and handover preparation. Three projects show how I approach practical engineering challenges in fiber-optic infrastructure.

01 / PROFILE

PROFESSIONAL PROFILE

WHO I AM

I am a surveying engineer working as a construction manager on fiber-optic infrastructure projects in Germany. I coordinate site crews, monitor progress and make sure that completed work is properly recorded and supported by clear technical documentation.

HOW I WORK

Construction management is not just about what gets built today. It is also about understanding which activities depend on each other, what must be completed first and what is still needed before acceptance. I combine practical site coordination with plan interpretation, surveying and quality checks.

02 / CAREER & EDUCATION

EXPERIENCE & EDUCATION

10/2024 — PRESENT

EGN Deutschland GmbH

FTTH Construction Manager · Heilbronn / Rastatt. Site and subcontractor coordination, quality and quantity checks, technical documentation.

04/2023 — 04/2024

SOLI Infratechnik GmbH

FTTH Construction Manager. Technical and commercial project delivery, progress monitoring, measurements and acceptance preparation.

04/2022 — 03/2023

Artemis ITS · Saarland

FTTH Construction Manager. Crew coordination, civil works, house connections and quality checks.

09/2021 — 03/2022

Surveying internship · Greece

Topographic field surveys, CAD/GIS processing and UAV data workflows.

EDUCATION / QUALIFICATIONS

Diploma in Rural and Surveying Engineering, Aristotle University of Thessaloniki. Professional title “Ingenieur” recognized by Ingenieurkammer Baden-Württemberg. DVGW GW 129 (2026).

03 / EXPERTISE

AREAS OF EXPERTISE

01 / SITE MANAGEMENT

Planning crew activities, coordinating subcontractors, communicating with project managers, tracking deadlines and preparing for acceptance.

02 / SURVEYING & PLANS

As-built surveys, technical drawings, FTTH route interpretation and accurate records of completed construction.

03 / QUALITY & QUANTITIES

Checking measured quantities, reviewing surface reinstatement and reconciling site records with completed work.

04 / SELECTED PROJECTS

THREE SELECTED PROJECTS

Three examples from my work. Each project explains the situation, my responsibility and why the decisions made a difference.

01 SAARLAND

02 HEILBRONN

03 WINTERSDORF

CASE STUDY 01 / PART 1 OF 2 / SAARLAND

SETTING THE RIGHT PRIORITIES

Artemis ITS · Rehlingen-Siersburg / Beckingen

THE CHALLENGE

Several crews were working on different but connected sections of the same FTTH rollout. The easiest section to continue was not always the one the municipality needed ready for its next acceptance.

MY APPROACH

I clarified priorities with Project Managers and Area Managers, who had a broader view of municipal deadlines and handover requirements. I then adjusted my crew’s work sequence accordingly.

CASE STUDY 01 / PART 2 OF 2 / SAARLAND

SETTING THE RIGHT PRIORITIES

Artemis ITS · Rehlingen-Siersburg / Beckingen

WHY DAILY COORDINATION WAS NOT ENOUGH

Direct communication between engineers helped solve immediate problems. But decisions affecting the overall project schedule required direction from the managers responsible for the wider rollout.

WHAT THIS PROJECT TAUGHT ME

Good site coordination means looking beyond the next task for one crew. Work should be sequenced around project-wide commitments and upcoming acceptances.

CASE STUDY 02 / PART 1 OF 2 / HEILBRONN

FOLLOWING THE FULL NETWORK ROUTE

EGN Deutschland GmbH · Baden-Württemberg

THE CHALLENGE

Our team was responsible for specific FTTH construction sections. The route to our distribution points also passed through ducts installed by a contractor who had previously left the project.

MY APPROACH

I reviewed the network plans, traced the intended route from the Point of Presence (PoP) to our distribution points and helped the fiber-blowing team identify the correct connections.

CASE STUDY 02 / PART 2 OF 2 / HEILBRONN

FOLLOWING THE FULL NETWORK ROUTE

EGN Deutschland GmbH · Baden-Württemberg

THE TECHNICAL ISSUE

The blowing technician could identify the distance at which the fiber stopped, but that did not always reveal which duct the planned route should follow next.

THE OUTCOME

Fiber blowing through the interconnected ducts was completed and the planned connections were established. The project showed why understanding the overall network matters as much as managing one construction section.

CASE STUDY 03 / PART 1 OF 2 / WINTERSDORF

VERIFYING THE WORK AS BUILT

EGN Deutschland GmbH · Rastatt

THE CHALLENGE

A closed trench does not automatically mean an FTTH section is ready for acceptance. Completed work, measured quantities and reinstated surfaces must match the technical records.

MY APPROACH

For supplementary works in Wintersdorf, I prepared as-built survey records and compared excavation quantities with asphalt base and wearing-course entries to identify inconsistencies.

CASE STUDY 03 / PART 2 OF 2 / WINTERSDORF

VERIFYING THE WORK AS BUILT

EGN Deutschland GmbH · Rastatt

WHAT I CHECKED

I looked for discrepancies and duplicate entries. Where required, the review also considered compaction-test results and the condition of reinstated surfaces.

WHY IT MATTERED

The checks made it easier to distinguish completed work from outstanding items and identify what documentation was still needed for technical review and acceptance preparation.

08 / CAPABILITIES & CONTACT

CAPABILITIES & CONTACT

TECHNICAL SKILLS

FTTH · Construction management · Surveying · As-built records · CAD / GIS · Excel · Quantity checks · Quality assurance

LANGUAGES

Greek: native · English: C2 · German: professional communication
